

Adding secondary signal to relay protection

Overview

The Secondary Injection Test procedure involves injecting a simulated current or voltage signal directly into a protection relay. This helps to test the relay's internal logic, settings, and trip functionalities without applying power to the entire system. The signals. ghly desirable attributes needed to achieve fast, secure, and reliable line protection. Long term cost reduction (TCO) for trainings and maintenance by reduce variety of relays A fast and selective arc fault mitigation for air-insulated LV & MV switchgear and Relion protection and control relays and sensor. The purpose of secondary injection testing is to prove the correct operation of the protection scheme that is downstream from the inputs to the protection relay (s).
