

Cable trays are installed as exposed conduits

Overview

Conduit systems are enclosed pipes that require precise bends, threading, and pulling. Cable trays, on the other hand, create an open containment system. Understanding the types of cable containment systems, including trays, trunks, and conduits, helps engineers and contractors select the best solution for performance, safety, and compliance. From small-scale residential projects to large-scale industrial installations, the decision on whether to use a cable tray or a conduit lies on the scale of the job as well as the amount of heat the wires will generate. Some tray cable, with XLPE insulation (cross-linked polyethylene), is sunlight resistant and suitable for installation in free air and hazardous locations - although this goes according to local regulations. Effective cable tray and conduit system planning is essential for both new installations and retrofit projects. It helps prevent overheating, mechanical damage, electromagnetic interference, and allows for future expansion. They're excellent for protecting individual circuits in harsh or public areas, but they're labour-intensive and slower on large cable counts.
