

Calculation of copper busbars in high-voltage busbar cabinets

Overview

Industrial high-voltage switchgear uses 100x10mm copper busbars (1850A ampacity) for a 3000A rated current. Copper busbar weight is calculated using: $\text{Weight (kg)} = \text{Cross-Sectional Area (mm}^2\text{)} \times \text{Length (m)} \times \rho$. In this new edition the calculation of current-carrying capacity has been greatly simplified by the provision of exact formulae for some common busbar configurations and graphical methods for others. Other sections have been updated and modified to reflect current practice. Copper Development. The busbar sizing calculator determines the required busbar dimensions based on the continuous current rating, short circuit withstand, and thermal limits for switchgear assemblies. The current rating is calculated from the conductor cross-sectional area, material (copper or aluminium), and maximum. This solid conductor bar is known as a busbar. “ Replaced three separate apps with Elec-Mate.
