

# Coupling of Fiber Array and Optical Chip

## Overview

Coupling is realized via total internal reflection (TIR) couplers that focus and redirect light from the on-chip waveguides into the fibers providing broadband, and low-loss coupling. Silicon photonics chip is to integrate waveguide, modulator, detector, MUX, and DeMUX on silicon platforms by using CMOS semiconductor technology. Compared with the traditional discrete devices, silicon photonics integrated chip is found to be featured with the characteristics of low cost, low. In this example we demonstrate optical fiber to photonic chip coupling with a microlens and edge coupler. We introduce Zemax OpticStudio as a necessary addition to account for propagation through the micro-optical elements under realistic misalignment. A high-precision core. This paper presents a low-loss and high-reliability optical coupling technique between silicon photodetector array chips and fiber arrays using end-face butt-coupling.
