

Dissipation of heat from electrical wiring in distribution boxes

Overview

Electrical equipment that distributes power has a heat loss due to the impedance and/or resistance of its conductors. This heat is radiated into the electrical room where the equipment is placed and must be removed to ensure excess heat does not cause failures. 7-1 provides heat loss in. The accumulation of heat in an enclosure is potentially damaging to electrical and electronic devices. Heat loss to the ambient air from some typical electrical equipment are indicated below: Transformers are in general highly efficient and large power transformers - 100 MVA and larger - can be more. For one situation I need to provide the heat dissipated for some routers, switches, UPSs, and two-way radio repeaters I'm installing in leased rack space in a equipment room. I also have a situation where I need to install a router and UPS in a storage cabinet in an RV type vehicle. High temperatures cause more than half of electrical device failures, so calculating heat dissipation helps you avoid costly breakdowns.
