

Fiber optic cable and twisted pair panel

Overview

Similar to a twisted pairs cable, there are two types of fiber optic cable: single mode fiber optic cable and multimode fiber optic cable. Both types use a thin strain of glass to transfer light. The sender device converts data into light and shine. Similar to a twisted pairs cable, there are two types of fiber optic cable: single mode fiber optic cable and multimode fiber optic cable. Both types use a thin strain of glass to transfer light. The sender device converts data into light and shines the light in the glass. The strain of glass, also known as the core, transports them to the receiver. There are two types of twisted pairs cable: shielded twisted pairs cable (STP) and unshielded twisted pairs cable (UTP). Both types use copper wires to transfer electric signals. The sender device converts data into electric signals and loads them on the copper wires. The copper wires transport them to the receiver device. The receiver device reads. You are not limited to using only one type of cable. You can mix cables in your network as per requirement. For example, if a segment is near electric machines, you can use SMF or STP cables in that segment. If two segments are located at a long distance, you can use an SMF cable to connect them. If you want to mix cables in a network, you need to.
