

# Hollow-core optical fiber air chamber

## Overview

Hollow-core fiber (HCF) replaces the glass core of conventional single-mode fiber (SMF) with an air-filled center. Author: the photonics expert Dr. Among them: Find more supplier details at the end of this Encyclopedia article, or go to our You are a not yet listed supplier?

Start with a free entry! Using our Advertising Package, you can. Optical signal in a hollow core anti-resonant fiber propagates in an air core surrounded by single ring of anti-resonant tube elements. Guidance is based on an anti-resonance from the thin glass membranes constituted by the non-touching tubes surrounding the hollow core. This reduces latency to around 3. Compared to solid-core optical fibers, HCFs exhibit ultra-low nonlinearity, high damage threshold, low latency and temperature.

Hollow-core Fibers – photonic bandgap fibers, air-guiding fibers

Low ReflectionHigh Group Velocity, Low Latency Signal TransmissionRaman Interactions in GasesReduced Coupling to laser-active DopantsThe group velocity of guided light in hollow-core fibers is usually close to the vacuum velocity of light, in contrast to conventional silica fibers having group velocities which are roughly 30% lower. This implies substantially lower latency for signal transmission through hollow-core fibers. In some specific application fields of optical fiber co...See more on rp-photonics Exail

Hollow core photonic bandgap fibers - Exail
