

How to calculate the 10kV busbar

Overview

Busbar voltage drop is calculated using $V_d = I \times Z \times L$, where I is the current, Z is the impedance per unit length ($R + jX$), and L is the busbar length. For a rectangular copper busbar, DC resistance per metre is $R = \rho / (\text{width} \times \text{thickness})$ in micro-ohms/m. The busbar sizing calculator determines the required busbar dimensions based on the continuous current rating, short circuit withstand, and thermal limits for switchgear assemblies. It is made from copper in the shape of a “bar”. Of course we can't bend it, roll it, or string it like wires. Even if you insist on using electrical wires, you. How to calculate the cross section of copper busbars for a 3 phase, 50 kW, 400 V system?

Solution Required Current (I) = $50000 / (400 \times 1$.
