

How to install the primary power distribution box in a tunnel

Overview

The standard practice is to install 3300 V “Half Couplers” on transformers that can be electrically interlocked. This “plug and socket” mechanism enables the installation to be quickly expanded as the tunnelling advances. In addition, through our involvement with many tunnel projects, we have acquired much practical experience in. Primary distribution systems consist of feeders that deliver power from distribution substations to distribution transformers. A feeder usually begins with a feeder breaker at the distribution substation. Therefore, equipment for supplying power to the tunnel must be installed. This installation has to satisfy two essential requirements: Meet the needs under all operational situations (normal, degraded, critical. Power supply and distribution in a tunnel Tunnels are home to a variety of applications that need to be supplied with power in a high-availability configuration. Particularly critical subsections, such as ventilation and lighting, must continue to work even in emergency situations, for example. Before starting the installation, finding a proper place for putting the distribution box is crucial, because it largely decides the safety and convenience of maintenance.
