

Interconnection of geographically located data centers

Overview

Data center interconnect (DCI) is private network connectivity between multiple data center facilities that lets you treat geographically separated infrastructure as a unified environment. Figure 1: Example of different data center interconnect (DCI) links. Instead of routing traffic between sites over the public internet, DCI uses dedicated circuits that provide. Interconnection is an over-arching term that refers to many different physical and virtual connections companies can select to exchange data, provide business continuity and customer services, and address specific business objectives. It plays an essential role in modern digital infrastructure, addressing the challenges of growing data volumes, cloud computing, and the need for robust disaster recovery. Data Center Interconnect (DCI) technology connects two or more data centers together over short, medium or long distances using high-speed packet-optical connectivity. These technologies can be deployed through various methods, and the right choice depends on factors such as required data transfer.
