

Multi-point fiber optic communication

Overview

Two main types of optical fiber used in optical communications include multi-mode optical fibers and single-mode optical fibers. A multi-mode optical fiber has a larger core (≥ 50 micrometers), allowing less precise, cheaper transmitters and receivers to connect to it as well as cheaper connectors. Overview Fiber-optic communication is a form of for from one place to another by sending pulses of or through an. The light is a form of. First developed in the 1970s, fiber-optics have revolutionized the industry and have played a major role in the advent of the. Because of its advantages over electrical transmission, optical fiber. is used by telecommunications companies to transmit telephone signals, Internet communication and cable television signals. It is also used in other industries, including medical, defense, governmenten.
