

# Optical fibers in optical cables transmit light

## Overview

Optical fibers are long, thin strands of carefully drawn glass with diameters in the microscale. The strands are arranged in bundles or “optical cables” and they transmit light signals over varying distances. Such fibers are widely used in fiber-optic communication, where they permit transmission over longer distances and at higher bandwidths (data transfer rates) than. In this article, we will learn about Optical Fiber Light Transmission, Optical fiber light transmission is a technology that enables the transmission of data and information through thin strands of glass or plastic fibers using light signals. In traditional copper wiring, electrical signals degrade over distance, leading to slow transmission speeds. Learn about their core and cladding structure, single-mode vs multi-mode fibers, and why optical communication powers our digital world.
