

# Optical module CRC packet loss

## Overview

Check Physical Health First: Many CRC or drop issues can stem from faulty cables, SFPs, or adapters. Store-and-Forward: Cut-through devices can pass corrupted frames onward, so the actual error source might be upstream. However, the display interface command output shows that packet loss occurs on the corresponding interface due to CRC errors. The receive optical power of the optical module is abnormal. If CRC error packets are continuously generated on an interface, the possible cause is that the transmission medium is faulty. For example, the connected twisted pair or optical fiber is faulty, or the. This guide provides a deep technical overview of how to troubleshoot sfp optical transceivers and other optical transceivers module types effectively in 2025. PER Calculation: The Packet Error Rate (PER) refers to the ratio of the number of erroneously received packets to the total number of packets received. You should have familiarity with: All.
