

# Optical module TX and RX ports

## Overview

It's commonly understood that a standard SFP module comprises two ports: Transmit (TX) and Receive (RX). The components housed within the Transmitter Optical Sub-Assembly (TOSA) facilitate the transmitting function, while those within the Receiver Optical Sub-Assembly (ROSA) handle. When designing optical networks, understanding the TX/RX power range is vital for ensuring optimal performance and long-term reliability. The TX (transmit) and RX (receive) power levels significantly affect everything from signal strength to transmission distances and the overall optical power. A direct and convenient measurement tool that measures the actual optical power at the fiber end face. SFP modules are small, hot-swappable devices used in both telecommunications and data communications. Standardized by the Multi-Source Agreement (MSA), SFPs are interoperable across different brands. SFP modules are transceivers that can be used to connect fiber optic cables in a network.
