

Optical module withstand voltage value

Overview

The root mean square (rms) value of the AC voltage that can be applied across an isolation barrier for up to 60 seconds without resulting in a breakdown is known as isolation withstand voltage, or 'VIOW' or 'VISO' for short. Defined by IEC/EN/DIN EN 60747-5-5. The philosophy underlying the partial discharge testing is that insulation for safe electrical isolation. test according to UL 1577. This is a one minute type test, where a voltage is applied between the input and output terminals of the isolator (destructive test). Typical withstand voltage ratings are 2500-5000 VRMS. When conducting high-voltage isolation tests, testers need to select the appropriate test standards for specific product characteristics.
