

Power is supplied from the distribution cabinet to the busbar box

Overview

Busbars carry power from the transformer to the low-voltage switchgear—in other words, the switches, fuses or circuit breakers that control, protect and isolate the electrical equipment. In a typical office building, the busbar system is installed under the raised floor. Traditional panel wiring systems — referred to as block-and-cable systems — are designed around large power distribution blocks (PDBs) that require large parallel cables. Each PDB feeds a specific part of the control panel, which, as enclosures continue to require more power in service of. Busbars are metallic strips or bars, typically made of copper or aluminum, that conduct electricity within a distribution system. They serve as the primary means of distributing power from incoming feeders to outgoing circuits. Yes! A Bus Bar Box is a high-capacity compact system used to replace traditional wiring and is called an alternative device.
