Overview

Differential Relay: Compares currents at two points; operates when there is a difference (used in transformers and generators). They are intended to quickly identify a fault and isolate it so the balance of the system. able sources such as wind and solar. These clean energy sources, connected through inverters and flexible transmission systems, are transforming traditional grids based on synchronous generators into more flexible cant challenges to system stability. Nowhere is that clearer than in the challenge to. Selectivity is a mandatory requirement for all protection, but the importance of it depends on the application. While this is bad, It's not a. In electrical engineering, a protective relay is a relay device designed to trip a circuit breaker when a fault is detected. Types of Protective Relays: Protective relays are categorized by their mechanism (electromagnetic, static, mechanical) and function. the pro-TECTIVE relay deals with.
