

Second-level Construction Main Distribution Box

Overview

Equipment inside usually includes isolating switches, circuit breakers, and residual current devices (RCDs). Supplies power to specific buildings or floors. Let's make a hypothesis: a newly built residential area introduces a 10kV incoming line and builds a distribution room. The outgoing line from the low-voltage end of the transformer is 0. Equipped with larger three-phase circuit. Primary distribution systems consist of feeders that deliver power from distribution substations to distribution transformers. Many feeders leave substation in a concrete ducts and are routed to a nearby pole. detailed explanation of DB, SDB, MDB, RMU, and Switchgear along with any commonly related equipment you might have missed, including their purpose, application, and hierarchy in an electrical distribution system. Tertiary Distribution Box: The final connection box for each electrical appliance, which can be movable or fixed. Level 1 required configuration: Main circuit isolation + main circuit breaker and main fuse Shunt isolation + shunt leakage protection switch Level II required configuration: Main circuit general isolation + main circuit fuse and circuit breaker Shunt isolation + shunt fuse and circuit breaker.
