

Spacing of seismic bracing for Oman cable trays

Overview

For rigid cable trays, it is established that the seismic supports should be spaced no more than 12 meters apart. 1 Codes and Standards The design of cable trays and their supports conform to. This article will explore the importance of seismic resistance in cable trays, discuss when seismic braces are necessary, and help you understand how to make informed decisions for your installation. Before diving deeper into the specifics, it's important to understand the various factors that. Eaton's TOLCO seismic bracing solutions help protect people and non-structural components during an earthquake. During an earthquake, non-structural systems such as pipelines, ducts, and cable trays are subjected to significant horizontal and vertical forces.
