

Structure of the bridge gantry

Overview

At the heart of every bridge gantry crane sits three main components: the bridge itself, the trolley, and the hoist mechanism. Most bridges are built as either single or double steel girders stretching across whatever workspace needs coverage while supporting the trolley's. Gantry cranes are essential lifting equipment used across various industries, including shipbuilding, construction, logistics and manufacturing. Their robust design and versatile functionality make them indispensable for handling heavy loads with precision and efficiency. That's why we see them all over places like shipping ports, train. With the improvement of domestic construction enterprises' capabilities in highway and railway bridge construction, China's bridge construction projects are showing a trend of larger spans and higher construction difficulty, which puts forward higher requirements for bridge construction technology. They are available in different configurations, including single and double girder models.
