

Supplemental Light Boost Module

Overview

Designed to provide supplemental or inter-canopy lighting coverage to boost plant yields. Crafted to Magnetically mount onto a grow tent's frame or canvas. Features ten dimming levels and daily schedule programming. Connects to UIS™ controllers for smart programs and app. The Lumatek Indoor Supplemental Light LED Range is designed to enhance the efficiency and performance of your commercial grow operation. You can either use it as an add-on for your grow space. Intensive growing systems used for greenhouse tomato production, together with light interception by cladding materials or other devices, may induce intracanopy mutual shading and create suboptimal environmental conditions for plant growth. There are a large number of published peer-reviewed. In a greenhouse crop with high planting density, low photosynthetic photon flux density (PPFD) at the lower leaves tends to limit plant growth, especially in the winter when the solar altitude and PPFD at the canopy are low and day length is shorter than in summer.
