

Switch Aggregation and Uplink

Overview

Aggregating multiple links between physical interfaces creates a single logical point-to-point trunk link or a LAG. The LAG balances traffic across the member links within an aggregated Ethernet bundle and effectively increases the uplink bandwidth. LACP (Link Aggregation Control Protocol): LACP is an industry-standard protocol (802.3ad). By bundling multiple network connections into a single high-bandwidth link, aggregation switches help. An Aggregation or "Top-of-Rack" switch is designed to connect everything in a rack at high speeds, then have an even bigger pipe out to the rest of the network. The regular Aggregation switch is best used to connect all devices in a rack. Configure link redundancy in network topologies with dual uplink between different layers of the network. Configure UFD to achieve network path redundancy. Applicable products, versions, ports and interfaces. Learn more about the new features and enhancements introduced in this release! When we have two or three tier design for campus LAN where we have Access, Distribution and and core layers.
