

Tensile strength of special optical cables

Overview

The fibre optic tensile strength standard, optical fibre compression load and fibre optic mechanical stress define critical limit values for installation: fibre optic cables withstand 600 to 2700 N tensile force during installation and 2000 N/10cm compression load depending on cable. The fibre optic tensile strength standard, optical fibre compression load and fibre optic mechanical stress define critical limit values for installation: fibre optic cables withstand 600 to 2700 N tensile force during installation and 2000 N/10cm compression load depending on cable. Optical fibre cables - Part 1-311: Generic specification - Basic optical cable test procedures - Cable element test methods - Tensile strength and elongation test for cable elements, Method G11A IEC 60794-1-311:2024 describes test procedures to be used in establishing uniform requirements of. rial environments. The cable is suitable for both indoor and ou door installation. The outer sheath is made from black UV-stabilized and weather resistant material which is SHF1 classified, and may be exposed for shorter periods to fluids such as diese and mineral oils. The resistance to these. This test method applies to optical fibre cables which are tested at a particular tensile strength in order to examine the behaviour of the attenuation and/or the fibre elongation strain as a function of the load on a cable which may occur during installation and operation.
