

The reason for the rubber ring on the end face of the PC ceramic ferrule

Overview

The reason for this may be that the anti-rotation pin is broken, or that the bore of the static ring gland is smaller than the outer diameter of the seal and is not installed in place. The end-face geometry compliance is critical for fiber optic interconnect solutions to perform reliably for extended periods of time while enduring common mechanical and connector polishing?

Fiber optic connector polishing is a very critical step after connectorization. Notching on one or both end faces, a phenomenon that indicates that the two end faces are separated by too large a distance, and when the two end faces are tightened with force, a gap is created. A common cause of endface separation is the rapid evaporation of the medium. For example, in water. The purpose of the vias is connecting the circuit ground to the chassis ground when the board is screwed down into an enclosure, isn't it?

The stitching vias improve the connectivity to the other side or internal planes, especially in the case where the hole plating of the actual screw bore or its. A ceramic circuit board is not a simple alternative to the ordinary PCB, but a more advanced technology. In other words, ceramic substrate PCBs can still operate stably and reliably in high-temperature, strong. The word 'ferrule' historically refers to a protective ring or cap used to reinforce or protect the end of a component. We're talking about industrial-grade ceramics like aluminum oxide (Al_2O_3), aluminum nitride (AlN), or.
