

What does CWDM mean for optical modules

Overview

A CWDM SFP module is an optical transceiver that uses Coarse Wavelength Division Multiplexing (CWDM) technology to transmit multiple data channels over a single strand of single-mode fiber, helping networks expand capacity without deploying additional fiber. Compared to dense wavelength division multiplexing (DWDM), its wavelength spacing is coarser (typically 20nm), hence the. WDM (Wavelength-division Multiplexing) transceiver modules, including CWDM and DWDM modules, use different wavelengths to multiplex several optical signals onto a single fiber. Learn all about CWDM, how it differs from DWDM, and whether a CWDM solution is right for your business's network. In this approach, the system converts an optical fiber channel that once carried only a single light signal into one.
