

# What does a three-stage beam splitter look like

## Overview

A third version of the beam splitter is a dichroic mirrored prism assembly which uses dichroic optical coatings to divide an incoming light beam into a number of spectrally distinct output beams. Overview A beam splitter or beamsplitter is an that splits a beam of into a transmitted and a reflected beam. It is a crucial part of many optical experimental and measurement systems, such as In its most common form, a cube, a beam splitter is made from two triangular glass which are glued together at their base using polyester,, or urethane-based adhesives. (Before these synthetic. Beam splitters are sometimes used to recombine beams of light, as in a. In this case there are two incoming beams, and potentially two outgoing beams. But the amplitudes.
