

What is the function of the light-finding module

Overview

The Lightseeking sensor Module can be used on a smart car robot for the experiment about light seeking. Since the resistance of a photoresistor decreases with stronger light, the car can be controlled to move based on the resistance change, that is, to seek for the light and follow it. Also the. The present invention pertains to a light receiving element and a range-finding module with which it is possible to improve characteristic features thereof. The light receiving element is provided with: an on-chip lens; a wiring layer; a first substrate interposed between the on-chip lens and the. With emphasis on highly portable light weight and low power design and use of state of art sensing techniques, Instro's North finding modules overcome the limitations of bulky gyro-compasses and associated batteries and enable inaccurate DMC based EO sensors to be used for CAT-1 applications. Light sensors come in different. Chances are, the lighting control module (LCM)—also known as the footwell module (FRM) in BMW models—is the root cause.
