

What is the purpose of creating VLANs on the core switch

Overview

By separating the internal LAN into different IP subnets (and thus different VLANs) allows the network administrators to enforce traffic restrictions if needed between departments and have better control of internal hosts. VLAN assignment on a switch is configured on a per-interface. A Virtual LAN (VLAN) is a logical grouping of devices within a network that allows them to communicate as if they are on the same local network, even if they are physically connected to different switches. It reduces unnecessary broadcast traffic, enhances security, and improves network. Initially there is a switch - the 'Main Switch' 2. Create a new 'VLAN / Switch' The 'Switch' above implies an 'imaginary | software based | virtual switch'. 'Shift / Assign' more ports from 'Main. By default, only VLAN 1 is configured on the switch, so if you connect hosts on an out-of-the-box switch they all belong to the same Layer 2 broadcast domain. VLANs break a large broadcast domain into smaller broadcast domains. A. If we do a simple VLAN definition, Virtual Local Area Networks are the Logical Virtual Networks that groups network devices in it. Understanding what is a purpose of implementing VLANs on a.
