

What protection is used for the 35kV busbar in a wind farm

Overview

Differential protection provides high speed fault-clearing necessary for critical busbars such as transmission busbars, or distribution busbars where arc flash hazards are a concern. The choice of protection technique used for a specific busbar depends on the protection requirements for speed and security, balanced against the cost of implementing a specific solution, and the operating requirements for a specific bus. Suitable for outdoor, indoor, or underground installation, it operates reliably in temperatures from -10°C to $+40^{\circ}\text{C}$ and. For those not familiar with the different elements that form a WEP, commonly known as a Wind Farm, this report introduces a description of the different elements comprising a wind farm and how their unique characteristics may be considered to provide a proper design. With busbars, significantly less and simpler connections have to be made and thus to longer interruptions of power generation. To face this, the LDM busbar trunking system satisfies the corresponding standard IEC 61439-1/-6: This standard postulates a. The two most commonly used schemes for busbar protection are : 1.
