

What's going on with the three-level protection in the distribution box

Overview

Part of a three-tier protection system, ensuring power safety at intermediary stages. Equipped with double doors for added protection, coated surfaces for durability, and a rainproof design for outdoor environments. The complete set of products can form a complete three-level protection system for construction electricity, achieving the goal of one machine, one switch, and one protection, which is very suitable for various standard engineering applications. The first level cabinet adopts bottom in and bottom. Handles three-phase power and typically connects to secondary loads such as motors or machinery. The final connection point for end-use devices, delivering 220V (single-phase) power. 4kV, power distribution is achieved through three levels of distribution boxes: the main distribution board, secondary distribution boards, and tertiary distribution boards. It is very suitable for all kinds of standard projects.
