

Where is the fiber optic cable connection room located

Overview

This is typically through an external wall or the basement, depending on the house's construction. Often, fiber enters the structure to a centralized rack or data room where it is connected to a modem. The modem connects to a network switch which connects each remote point (rooms, floors, distributed network switches, etc. Larger projects often feature a main. Since a copper-based network has a maximum transmission distance of about 90 m, larger properties require connection rooms on each floor or each building where the signal is recreated in Switches, to finally reach each end user. Contemplate where you'll need the most bandwidth – perhaps in your home office or entertainment center – to place the necessary outlets. Inside, the cable is usually run.
