

Where should surge protectors be installed on the wiring cabinet

Overview

Surge protection devices are always installed where cables are fed into the control cabinet. Among other things, standardized requirements for line lengths, effective protection areas and fuse. Understanding where surge protection should be installed starts with the Lightning Protection Zone (LPZ) model in IEC 62305-4. Installing SPDs at LPZ boundaries ensures each stage absorbs surge energy. Proper placement of Surge Protective Devices (SPDs) is the single most critical factor determining whether your facility withstands a catastrophic electrical event or suffers thousands of dollars in equipment damage. Drill and punch a hole in the SPD housing in a position to minimize the length of the connecting wires from the lugs of the SPD to the circuit breaker in the adjacent panel (or fused disconnect lugs). This provides protection for.
